Vintage Strings MkII Free Download

Vintage Strings MkII is a VSTi virtual string machine that perfectly recreates the lush sound of analog string machines. Like these old machines, Vintage Strings MkII is a synthesizer that was especially designed to produce rich warm string pads. This virtual string machine make no use samples, so any of its presets can be tweaked, and new ones can be easily created, making Vintage Strings MkII as user friendly as it is toneful. Now with a completely revamped chorus section and the addition of a new reverb section, Vintage Strings MkII is even better. Give Vintage Strings MkII a shot if you want the classic sound of analog string machines. Requirements: ? Processor Pentium 4/AMD 1500 MHz or better ? RAM 256 MB or more ? Free disc space 3 MB of hard disk space ? Host Application Cubase SX/SL, Nuendo (1.5 or higher) or other VST 2.0 compatible host application. Lung cancer is the leading cause of cancer deaths in both men and women in the United States and is a major worldwide problem. It is estimated that there will be about 1.3 million new cases of lung cancer in 2001 and the death rate is about 1 in 2 (Boring et al. CA: A Cancer Journal for Clinicians 51:23-45, 2001). Despite advances in detection and management of lung cancer, the 5 year survival rate is only 15% and many patients die from recurrence within one year. Current treatment strategies for early-stage lung cancer include surgery for small tumors that can be completely resected, and medical therapy for early-stage non-small cell lung cancers (NSCLC). Standard first-line treatment of advanced NSCLC includes platinum-based chemotherapy (e.g., cisplatin or carboplatin). Combination chemotherapy with paclitaxel and carboplatin is one of the standards of care for NSCLC patients, which is now an accepted regimen for the treatment of patients with advanced disease. However, most patients develop drug resistance, and ultimately have an unfavorable outcome (Stathopoulou et al. Lancet 359:832-836, 2002). One of the major barriers to the development of lung cancer therapy is the failure to detect small subpopulations of cells that exhibit the ability to self-renew and to differentiate into multiple distinct cellular lineages. The identification and characterization of the biological and clinical significance of stem cells has emerged as one of the most important recent advances in cancer research. These cells are believed to play an important role in the growth, recurrence, and metastasis of tumors. They have been implicated in tumorigenesis, cancer metastasis, tumor drug resistance, cancer recurrence, and therapeutic resistance. Various cellular
